After 40 years of no one bothering, I decided to disassemble 2.2 in its entirety to facilitate my next masterpiece.

After I am done updating this to CP/M 2.5 (40/80), I will complete 3.1, which has been a semi-working hack at the moment.

Until then, here is an unofficial bug update.

For 40 years the "ESC c" background feature never worked. It was literally missing code that transferred the desired effect to the VDP.

You can call it lack of quality control or rush to market, but what you can't say is that I didn't fix the thing, and I want it put into the history books.
